Iteration 3 – review project architecture and iteration summary

Participants: dev team - Itai Ezra, Nachum Shpigelman, Yogev Cohen.
                Client - Igor ostinsky.
Date: 7.1.13

At the end of Iteration 3, we met with igor which is not only our client, but a tech advisor as well.
We took a look at the web and app architecture and come to the following conclusions:

Web:
1. The web works as expected, system looks stable.
2. There are some unused functions that we might use in the future.
3. User should be allowed to visit any re profile page, if we enable that, we need to duplicate re pages or implement different page permissions.
4. Add function to web: Add friends.

App:
1. The App works as expected, activities are divided in a way that each activity isn't working too long.
2. There is an option to add register to the app, even thou it wasn't in our plans, there is a layout for that.
3. There is a need to fix buttons layout, some of them are not in place.
4. Add function to app: Add friends.

- Remove all redundant code from web and app.
